

Parts of Your Eye

There are many parts of your eye that all do different things! Here we're going to focus on parts that we need to protect in the sun: the **lens** and the **cornea**.

If you want to learn more about the parts of your eye, check out [KidsHealth: Your Eyes](#).

Lens

This part is inside your eye, behind the iris (or the colorful part of your eye).

After light passes the cornea and pupil, it goes through the lens which focuses the light rays onto the back of the eye. This helps you see the world in focus.

Cornea

This part is clear and sits on the front of your eye. It helps to focus your eye as light goes through the pupil.
