

# The Tooth Fairy Project

ROHHAD affects cells from the nervous system. These cells have always been almost impossible to obtain for research. It was recently discovered that these cells can be obtained from teeth. Our research team wants to investigate the changes in the way nervous system cells from patients with ROHHAD function compared to those from people without ROHHAD by using cells from teeth.

## How can **YOU** help?

If you or your child with ROHHAD is about to start losing baby teeth or will be getting any teeth removed in the near future, please contact [CAMP@luriechildrens.org](mailto:CAMP@luriechildrens.org) **before** the tooth has fallen out or been removed. This will allow us to mail out a tooth collection kit to your preferred address ahead of time.
